

NOOSKI

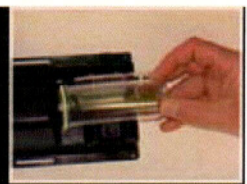

TRAP SYSTEMS

Safe

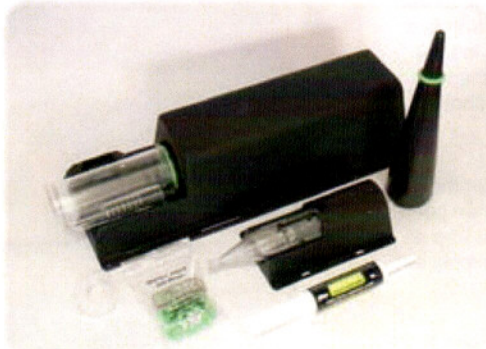

Clean

Easy

*The Nooski Revolutionary Ring Trap.
Kills rodents everytime...guaranteed.*

THE NOOSKI ADVANTAGE

- Kills everytime - guaranteed
- Kills quickly and humanely
- Quick, easy and safe to use
- No more jammed fingers
- Safer around children and pets
- No mess, rodent dies next to trap
- No rust, stainless steel spring
- Environmentally friendly, no poison
- Multi-bait design
- Bait lasts longer with tunnel design
- Can be set on ground or in trees
- Tunnel design reduces trap shyness
- A complete system, not just a trap
- Multi-animal design, Target Specific rodents, squirrels etc
- Designed for domestic and commercial use
- Made from industrial grade plastics with UV stabilizers, practically indestructible
- The most competitively priced complete trap system available
- 100% designed and made in New Zealand

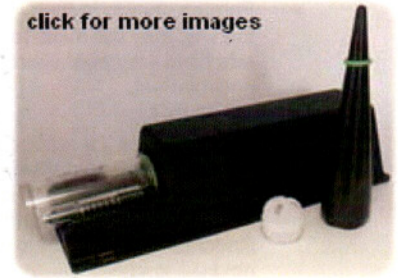

The NOOSKI Ring

Made from natural latex rubber the NOOSKI ring is environmentally friendly. Once set the ring will successfully kill rodents for up to a year, it is recommended however, to change the rings every 4-6 weeks. The same ring is used for both the rat and mouse trap.

Products

The NOOSKI Rat Trap

Safety Tunnel

Unique to NOOSKI is a safety tunnel that is actually an integral part of the Trap System. Constructed from U.V. Stabilized PP.

Bait Capsule

Prevents bait steals from mice and keeps the trap clean.

Trigger Housing

Constructed from Polycarbonate and featuring a 304 Stainless Steel spring. Tube design provides 100% bait protection from the weather and non target species.

Loading Cone

Supple yet robust HPDE material. An essential tool for loading the powerful killing ring.

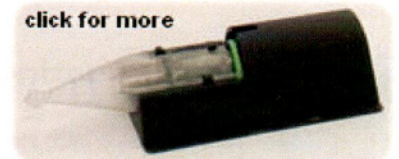

Ring

Natural Latex rubber.

Dimensions

Length: 320mm, Width: 125mm, Height: 73mm, Weight: 225 grams.

click for more

The NOOSKI Mouse Trap

Trigger Housing

Simply roll the ring into position, no separate loading cone required. Built from tough ABS plastic, the NOOSKI Mouse Trap is guaranteed to give 100% success, everytime.

Safety Tunnel

Acting as the bait container as well as the safety tunnel. The safety tunnel allows you to set the trap inside without worry of pets or children setting it off.

Dimensions

Length: 150mm, Width: 56mm, Height: 33mm, Weight: 50 grams.

Rodent Trapping Tips

- Rats are extremely shy and suspicious, therefore trapping a rat requires a little human ingenuity.
- Foreign objects in their natural environment, whether they be in the forest or the city, they will avoid for up to a week. It is thought that smell, (not sight as rats have very poor vision) is their biggest concern with new objects in their environment.
- In most cases if a rat or rats are proving difficult to catch, it is preferable to set several traps within a small area, thus creating a false sense that the trap is a part of the natural environment. By leaving the NOOSKI safety tunnel in their natural environment permanently, they will become comfortable with the trap. Rodents acclimatising to the addition of the trigger housing once set, should not take long.
- If a rat is proving difficult to catch, try to remove it's food source and set the trap with the same food e.g. if a rat is into grass seed in the garage, then put it out of reach and set the trap with seed. Don't put teaser bait round the trap as there is no evidence in tests that this increases your catch. Rats will simply eat the teaser bait and not enter the trap.
- Although a rat will eat practically anything, they prefer meat, fish & cereal. If the food is disagreeable, they develop food shyness. If acceptable, they eat their fill at one sitting and return time after time. Chocolate, peanut butter, cheese, dog biscuits, grain, milk powder and fish meal, all work successfully in the NOOSKI Trap System.
- It is recommended not to touch the trap once set for at least a week. If you have no luck, try different bait, but don't move the trap.
- It is recommended to replace the NOOSKI ring every four weeks, although will still be effective for up to eight weeks and more.
- When setting the NOOSKI trap, look for droppings, burrows, runways or gnaw marks on objects. Try to set at parallel against a wall, as rats typically travel along walls as opposed to crossing open rooms. This also applies to the outside of buildings and in the bush against trees, stumps or fallen logs.

Trouble Shooting

- Q. How can I stop mice stealing the bait?
A. Set a NOOSKI mouse trap or use the NOOSKI bait capsule.
- Q. How often do I replace the rings?
A. Once set the ring will be effective for several months, however, it is recommended to replace the ring every 4 weeks.
- Q. Is the sensitivity of the trap adjustable?
A. Yes, simply set the trigger at varying depths.
- Q. Why can't I catch a Rat?
A. There may be several reasons:
1. Ensure the trap is positioned against a wall or object that the rats are travelling along. Do not set the trap in open spaces.
 2. Once set do not keep moving the trap.
 3. Change the type of bait - banana, chocolate, peanut butter and aniseed are recommended.
 4. Tests have shown that several NOOSKI traps set in an area will produce better results than a single trap.
